River forcing, seasonal climatology (1980–2023)

Discharge/DOC: day-of-year mean (line) + 10-90th percentile (shaded), all 44 years of the interannual record.
Water temp/wind: the shared single-year climatology both run families use -- met/tide forcing has no interannual equivalent.

*Discharge/DOC: day-of-year mean + 10-90th percentile across all 44 years of forcing/*_interannual_1980-2023_*.csv (tools/build_interannual_forcings.py). Water temp/wind: forcing/river_watertemp_2022_degC.csv, watertemp.csv, windspeed.csv (shared regional record, not per-river, not interannual). No model run needed.*
