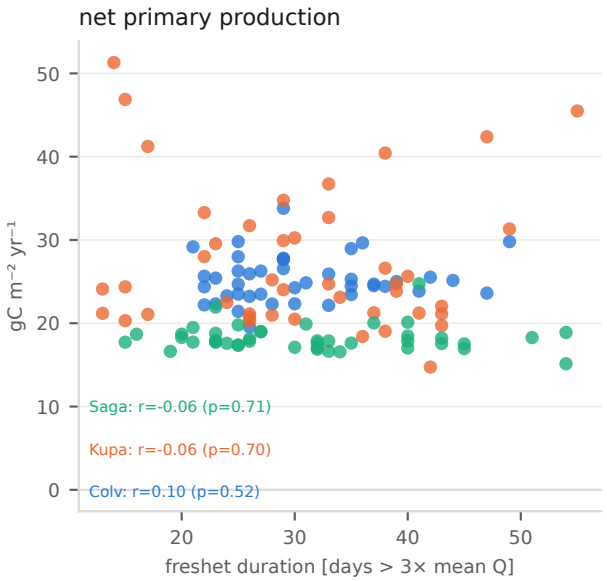
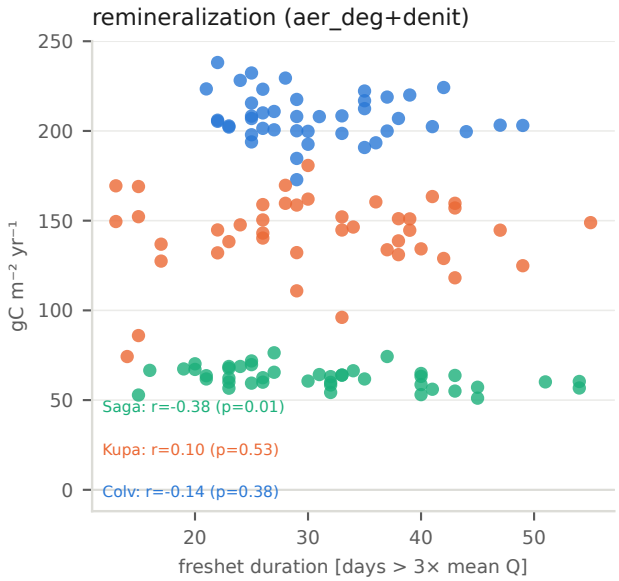
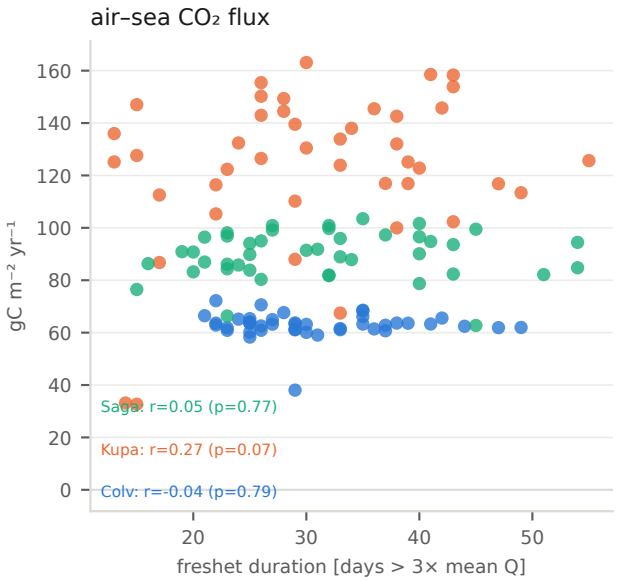
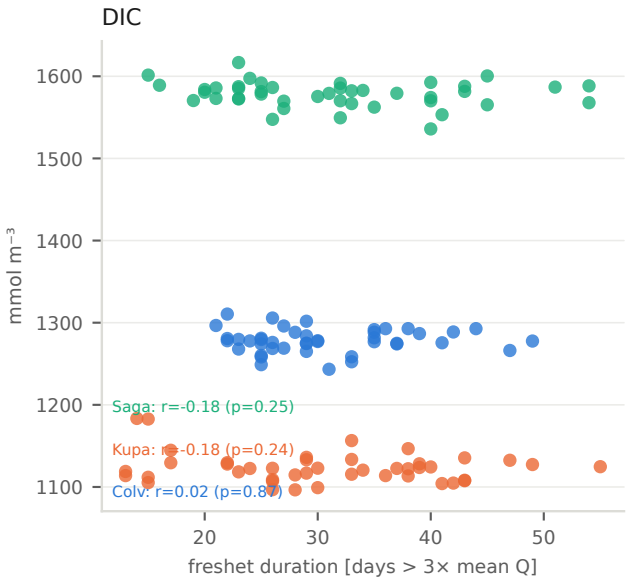
Does freshet duration/intensity shape estuarine biogeochemistry?

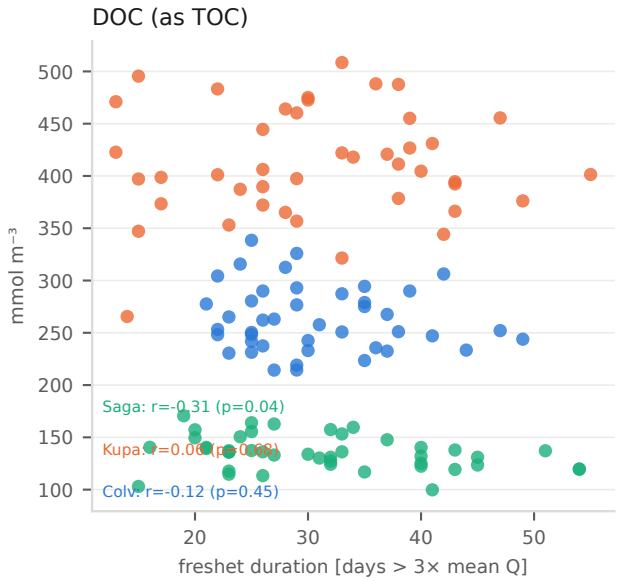
Freshet duration (days > BREAKUP_Q_FACTOR× that year's mean Q -- I.freshet_metrics' own definition) vs. annual budgets/means of each response variable, 1981–2023, one point per site-year. Rat

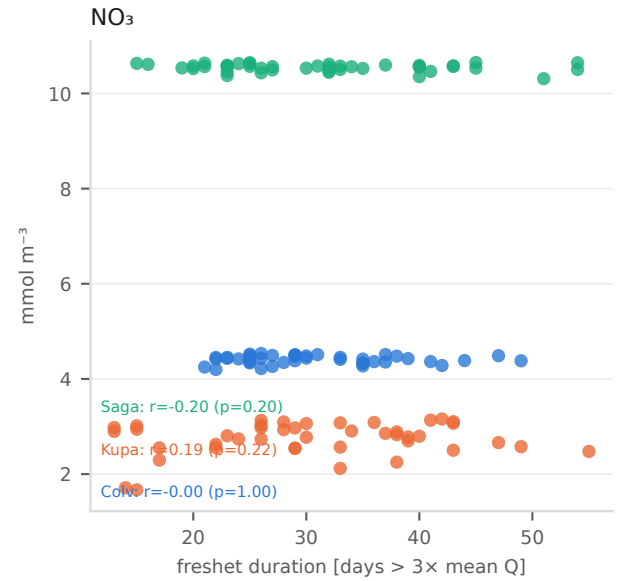












FORTE Hypothesis 1: spring-freshet timing/intensity modulate carbon/nutrient fluxes and air-sea CO2 flux. Uses runs/interannual/ (43 post-warmup years). Upstream boundaries (except T, and TOC in the 44-yr record) are CONSTANT -- structure shown here is the model's own internal dynamics acting on a constant source, not a real time-varying river signal. See CLAUDE.md -> "Publication figure suite".
